Directions for questions 6 to 10:

Read the passage and answer the questions that follow:

Even as car shoppers look over new models in dealer showrooms, some of them are being sized up themselves. In Cadillac, Mercedes and BMW showrooms around the United States, researchers hired by the Toyota Motor Corporation discretely watched prospective car buyers inspect the cars. The researchers noted not only whether the customers kicked the tyres but also how they dressed, what questions they asked and whether they appeared timid or confident.

"Just asking people questions is not going to reveal anything about them," said a professor of marketing and psychology." The best way to get an in-depth understanding of consumer values is to watch people buying and using products." Such people watching are the newest trend in consumer research, marketing experts say. A rather daring technique five years ago, the hiring of cultural anthropologists to observe and often videotape consumers in stores, shopping malls and even their own homes has become a standard practice for many large corporations and some of the

leading advertising agencies.

Companies with radically different approaches to marketing from Toyota, known for its adventuresome style to the far more conservative Procter & Gamble have come to rely on what is known in the industry as observational research. Such researchers study consumer attitudes towards a wide range of products and services, including fast food, over the counter medicines, household products, travel and personal care items.

What companies spend on such research is usually a closely held secret. Most marketers refuse to discuss details of people watching projects and the way in which the information is being used. But industry analysts estimate that companies spend millions of dollars watching Americans to discover the often hidden impulses that prompt them to buy an expensive car, eat gourmet ice cream, and wash their clothes with a particular detergent.
